depth. Most earthquakes of the Kuriles-Kamchatka zone have a focal depth of 30-80 km. A characteristic feature of this zone is the negligible number of earthquakes with surface foci. 5. The damping of transverse waves from earthquakes to the east of Kamchatka can be explained by the presence of a magmatic layer in the south part of Kamchatka. 15 references.

AUTHOR: Tarakanov, R.Z.

TITLE: Recurrent shocks of the earthquake of November 4, 1952

PUBLICATION: Referativnyy zhurnal, Geofizika, no. 10, 1962, 23, abstract 10A152 (Tr. Sakhalinsk. kompleks. n.-i. in-t, no. 10, 1961, 112-116)

TEXT: An earthquake with an epicenter at sea off the south-east end of the Kamchatka Peninsula and a focal depth of 30-40 km caused a tsunami and was accompanied by numerous aftershocks. The processing of 439 aftershocks (in the interval from November 4, 1952 to December 31, 1953) shows that the epicenters were confined to the active zone, stretching along the Kuriles-Kamchatka arc to the east of it, and were evidently connected with tectonic fracturing. The focal depth increases westwards from the Kuriles Depression: from 25-40 km (in the north) and 40-60 km (in the south) to 50-60 km and 70-120 km respectively. The aftershock magnitude was determined

Card 1/2

Recurrent shocks ...

S/169/62/000/010/020/071
S228/J307

from the surface wave maximum and was used to calculate the dependence on time of the seismic energy released daily. Separate graphs were prepared for three belts in the active zone. With the elapse of time the seismic activity shifted westwards. The relationship had a periodic character (with close period values) in all belts; with time the activity in the most easterly zone (beyond the depression) dwindled to nothing, but the period increased in the other two.

TEXT: The polyamides AK-7, П-6 (Р-6) and П-68 (Р-68) are widely used in the manufacture of gears which are lighter, quieter, longer-lasting and require no lubrication. They are, however, subject to deformation as a result of variations in temperature and relative humidity and these factors must be taken into account in the specifications. The weak points of several types of polyamide gears are illustrations.

TITLE: Spectral Analysis by the Evaporation Method. V. Analysis
of Plutonium by the Method of Evaporation in Vacuum.
(Spektral'nyy analiz po metodu ispareniya. V. Analiz plu-
toniya metodom ispareniya v vakuume)

PERIODICAL: Optika i Spektroskopiya, 1957, Vol.III, Nr.1, pp.16-20.
(USSR)

ABSTRACT: Refs. 1-3 describe spectral analysis using the evaporation
method. This method is applied here to plutonium which
presents particular difficulties because of its chemical
toxicity, -activity and absence of data on its physical
properties. A technique was developed using thorium,
lanthanum and uranium in place of plutonium. First the
general character of the spectrum was investigated. A
sample of plutonium was obtained by depositing a drop of
 $PuCl_4$ on a copper electrode. This drop was slowly evapo-
rated to form a layer of plutonium oxychloride. This elec-
trode was then placed in a chamber with four quartz windows
(Fig.1). This arrangement permitted recording of
spark and arc spectra by four

Card 1/3

51-1-3/18

Spectral Analysis by the Evaporation Method. V. Analysis of Plutonium by the Method of Evaporation in Vacuum.

instruments simultaneously. The plutonium spectrum was excited in argon at 500 mm Hg. Using four spectrographs plutonium spectra in the region 2000-6500 Å were obtained (Fig.2). The spectra obtained indicated that determination of the amounts of Ca, Ti, W, Mo and Al in Pu was possible by combustion of Pu chloride deposits (sensitivity of 0.005-0.01%). Enrichment would be necessary for determination of many impurities. The authors found that PuO_2 was the best substance to use for spectral analysis provided it was not heated above 1800°C. At 1800°C about 0.001% of Pu evaporated in 1 minute. In the standards necessary for this type of analysis PuO_2 could be replaced by ThO_2 . Using ThO_2 standards, Na, K, Li, Mn, Si, B, Co, Cd, Ag impurities in Pu could be determined quantitatively. The technique of preparation of those standards is described in Ref.1. PuO_2 was prepared by heating of Pu in a muffle furnace. The sensitivity and precision of determination of volatile impurities in PuO_2 is no lower than for similar analysis

Card 2/3

51-143/18

Spectral Analysis by the Evaporation Method. V. Analysis of Plutonium by the Method of Evaporation in Vacuum.

of other metals (Th, U, Zr, Be). In some cases only 1-2 μ g of Pu were necessary. No numerical results of Pu analysis are given in this paper. The authors thank M. P. Chayka, G. I. Zhuravlev, T. G. Fedorov and L. I. Averbakh who took part in some of this work. There are 2 figures, 1 table and 9 references, 6 of which are Slavic.

One hydroelectric station was using water from a river which had a large content of carbonate hardness and a small quantity of free carbonic acid. Deposits in the condenser pipe increased to 2-3 mm. Attempted to use hydrochloric acid to clean pipes, but there was a shortage of this acid. In Aug 67, began to treat the circulating water with doses of solid superphosphate estimate: a 2-3 mg/l doses of P₂O₅ was maintained in the pipe. Results were very satisfactory.

"Therapeutic Use of Bromine and Its Compounds,"
Prof. E. I. Tarakanov (Moscow)

Klin Ned, Vol 31, No 9, pp 14-22

The use of bromides is fully indicated in cases of
gastrointestinal ulcer because of disturbances of
the function of cortical inhibition. Individual
differences must be taken into consideration in each
case to determine what doses would produce the best
therapeutic effect. In cases of thyrotoxicosis the

270760

amount of iodine in the thyroid gland is low; the
amount of bromine is 2 to 3 times greater than nor-
mal. Oral administration of optimal dose of sodium
bromide in combustion with small doses of iodine is
an effective method for the treatment of thyro-
toxicosis. The value of small doses of bromides in
combination with microdoses of iodine is not yet
adequately known.

1790. *Hormonally active tumours of the adrenal cortex (Russian text)* TARAKANOV, E. I.
All-Union Inst. of Exp. Endocrinol., Moscow *Probl. Endokr.* 1956, 2, 5 (61-71)
Illus. 11

Thirty-five different tumours of the adrenals were analysed on clinico-morphological criteria. Three tumours presented as neoplasms arising from intertinal tissue ectopically located in the region of the pelvis minor and in the ovary. There were 16 tumours of the adrenal cortex with a clinical picture of virilism, 9 being benign and 7 malignant adenomata. The benign tumours of the adrenal cortical substance (androsteratomata) with virilizing syndrome consisted of ill-defined adrenal cells containing hardly any lipoids. The urinary 17-ketosteroid excretion was markedly diminished. The androsteratomata often underwent malignant change. Nine tumours were related to the so-called metabolic group (corticoandrosteratomata). The main bulk of such tumours is composed of clear cells with foamy, coarse-grained and finely-vacuolated protoplasm and lightly-staining nuclei poor in chromatin, and of darkly-staining cells forming small groups scattered about in proximity to the vessels. Attention is drawn to the pleomorphism of the nuclei, especially marked in the dark cells. There is an abundance of lipoids in the cells of the corticosteratomata. There is a considerably reduced production of 17-ketosteroids in patients with tumours of this type. The hypothesis is adduced that in the presence of an adrenal tumour there is a change in the reciprocal relationship between its parenchymatous elements and the blood, and also between the cortical and the medullary substance.

TITLE: Theory of measuring the force of gravity from an aircraft by using three orthogonal string gages. II

SOURCE: AN SSSR. Izvestiya. Fizika Zemli, no. 10, 1965, 72-82

TOPIC TAGS: gravimeter, earth science instrument, gyrostabilized platform, earth gravity

ABSTRACT: This paper is a continuation of a previous article (Izv. AN SSSR, Fizika Zemli, No 5, 1965) in which a formula was derived for calculating the increment in the force of gravity in air Δg with respect to a reference point on the ground. Δg was expressed in terms of the increment in frequencies of transverse vibrations of the orthogonal filaments as well as various parameters characterizing the flight of the aircraft. This formula was derived for a filament with constant tension. In the present article, the author considers special cases of measuring the force of gravity on an ideal gyroscopic platform and in an ideal Cardan suspension for transverse vibrations of a loaded filament with variable tension. The total error in measurement of

L 25544-66

ACC NR: AP6005838

the force of gravity is estimated for the general case. An approximate formula is derived for calculating the undisturbed force of gravity using string gravimeters on a gyroscopic platform which is kept level within an accuracy of $\pm 10'$. Formulas are given for calculating the permissible errors in measurement of isolated disturbances when the instruments are mounted on a gyroscopic platform. The third paper in this series will be devoted to methods of dealing with forward acceleration, rotational accelerations and other disturbances. Orig. art. has: 1 figure, 34 formulas, 4 tables.

TITLE: The theory of a torsion balance on a moving platform

SOURCE: AN SSSR. Izvestiya. Fizika Zemli, no. 3, 1966, 91-96

TOPIC TAGS: gravimetry, gravity, ~~strength~~, torsion ~~strength~~, ~~acceleration~~, ~~gradiometer~~

ABSTRACT: The authors investigated the behavior of proposed models of a vertical (gravity) gradiometer on a moving platform to determine the nature and magnitude of the errors affecting the sensing system of the instrument. The design investigated is based on the torsion balance principle. It was found that the gradiometer is not sensitive to transferred accelerations if the center of gravity of the balance beam coincides with the pivotal axis and the weights can move only along the walls of the instrument casing. Even an ideal gradiometer system installed on a moving platform is not free of perturbations. When the bob threads deviate from the plumb line under the influence of horizontally transferred accelerations of the platform, the gradiometer becomes highly sensitive to the force of gravity. The measurement of the vertical gradient may be conducted in a coupled system in which the bob threads retain a constant position relative to the instrument casing; in this case, the

Card 1/2

UDC 550,881

L 30085-66

ACC NR: AP6010068

"influence of the force of gravity is excluded completely, and the influence of errors is considerably reduced. However, even in this case, the registration of the vertical gradient of gravity will be perturbed. Therefore, it is necessary to adopt some method of filtration, as in the case of gravity measurements. Orig. art. has: 1 figure and 17 formulas. [68]

TITLE: Linear methods of smoothing random processes when measuring gravity while in movement

SOURCE: AN SSSR. Izv. Seriya geofizicheskaya, no. 5, 1964, 733-738

TOPIC TAGS: geophysical method, gravity, random process, instrumental smoothing, linear dynamic system, gravimeter

ABSTRACT: When measuring gravity from a moving base (such as a ship or an airplane), the inertial acceleration is hundreds and thousands of times the value of the measured gravity anomaly. Gravimeters with large damping and electrical filters with large time constants are used to offset this, but the efficiency of using such equipment is based on the assumption that the acceleration of the base is a harmonic function of time. Accelerometer measurements in an airplane indicate that this may be an erroneous assumption. With this in view, the author considers the effect of an accelerating base on the working system of a supported gravimeter having a horizontal pendulum. The principal disturbing effect on the system will be the vertical component of movement of the base. The author sets up an equation to account for this, and then carries through a derivation of the total effect. In comparing

Card 1/2

ACCESSION NR: AP4038148

instrumental methods of smoothing nonperiodic random processes with simple averaging, he concludes that the two techniques are of about equal value in regard to the smallness of the averaging errors. The random process has lower dispersion at the output of a linear dynamic system than at the input, which makes the method more correlative and involves fewer observations. As a result, any errors in the averaging process at the output of a dynamic system asymptotically approach from below the errors in averaging the process at the input. The results of instrumental smoothing of random disturbances thus prove to differ substantially from results obtained by such a method on harmonic noise. Orig. art. has: 21 formulas.

TITLE: Effect of chromium on the deoxidizing capacity of silicon in nickel and chromium melts

SOURCE: AN SSSR. Doklady, v. 163, no. 1, 1965, 166-168

TOPIC TAGS: deoxidizing capacity, nickel containing melt, chromium containing melt, silicon, oxide phase, oxidation potential, activity coefficient, melt deoxidation

ABSTRACT: The effect of chromium on the deoxidizing capacity of silicon in melts of nickel and chromium was determined with the aid of a previously described technique (V. V. Averin, P. A. Cherkasov, A. M. Samarin, Tr. inst. metallurgii, 11, Izd. AN SSSR, 1962, p 36) for investigating the equilibrium between the melts, the oxide phase, and a steam-hydrogen mixture with known oxidation potential. The deoxidizing capacity of silicon was determined at 1600°C in Ni melts containing 5, 10, 15, and 20% Cr; the concentration of Si

Card 1/3

L 63762-65

ACCESSION NR: AP5018092

ranged from 0.1 to 2.0%. Electrolytic nickel and chromium, pure silicon, and zirconium-dioxide crucibles were used in this investigation. Fig. 1 shows the solubility of oxygen as a function of Si content in a Fe alloy containing 20% Cr and in pure nickel: it can be seen that the solubility of oxygen decreases with increasing content of silicon in the melts. The effect of silicon on the activity of oxygen, determined on the basis of these findings, was found to decrease with increasing content of Cr in the melt (Fig. 2): this effect reaches its maximum for a Ni melt containing 5% Cr, whereas in a Ni melt containing 20% Cr silicon virtually does not affect the activity of oxygen. By contrast, the activity coefficient of silicon increases with increasing concentration of Cr, since the presence of Cr weakens the strength of the bonding between Si and Ni. The method of calculating the activity coefficient of Si, also described previously by the authors (see bibl. ref. above), can be used when the concentration of Si is such as to condition the formation of the oxide phase (products of the deoxidation reaction), which entirely consists of silica. However, the concentration of Si required for this purpose varies as a function of the concentration of Cr. For example, in a Ni-Si melt containing more than 0.17 Si the deoxidation product is pure silica, whereas the addition of 5% Cr to the molten Ni causes the appearance of silica in the presence of as little as 0.25-

magnetic fieldSOURCE: Fiziologiya rasteniy, v. 12, no. 5, 1965, 920-929TOPIC TAGS: magnetic field, biological effect, plant physiology, plant respiration,
plant metabolism, plant development

ABSTRACT: A study has been made of the effect of a stationary magnetic field produced by ring magnets on the oxygen consumption and growth-zone cytology of three-day-old sprouts grown in the dark. The field strength at seed level was 58, 62, and 100 oe. "Vyatka" rye, "Nemchinovskaya" lupine, horse beans, and "Nerosimiya" cucumbers were tested. The seeds were grown in 0.7% agar in a circle around the south magnetic pole of the field. At a field strength of 58 and 62 oe, the growth of sprouts was accelerated. A field of 100 oe did not appreciably affect the growth of rye. The greatest effect of the field was observed when temperature conditions were optimum for the given type of plant. Fields of 58 and 62 oe inhibited the absorption of oxygen by sprouts; the greatest inhibiting effect was observed when the seeds were swelling. A magnetic field slightly lowered the dry mass of sprouts per unit length but did not affect its expenditure relative to controls. The RNA content in the growth zone

Card 1/2

L 3989-66

ACC NR: AP5024603

of the stems and roots of maize and lupine increased in a magnetic field, but the DNA content remained relatively constant. The mitotic coefficient in the embryonic zone of lupine and rye roots increased in a 62-oe field, mostly during early mitotic phases. The size of cells in the root-elongation zone of lupine and rye increased approximately 18% in a magnetic field. Orig. art. has: 10 tables and 1 figure. [CD]
